

# ReWalk™

## Restoring Upright Mobility, Rediscovering Inclusion

**ReWalk™** from **Argo Medical Technologies** does far more than restore upright mobility to people with severe walking impairments. By enabling wheelchair users to stand, walk, handle stairs and more, **ReWalk** delivers quality of life, independence, health and inclusion.

### The ReWalk™ Family

Argo brings mobility face-to-face with society. **ReWalk**, the first commercially viable upright walking restoration device, is available in two versions:

- **ReWalk™-I** - aimed at institutions for use in intensive functional locomotion therapy. ReWalk-I is also intended to prepare patients to use ReWalk-P.
- **ReWalk™-P** - the personal device, intended for daily use in urban environment.

## Works with Users – Not Just for Them

**ReWalk™** is a wearable, motorized exoskeleton suit. **ReWalk** provides user-initiated mobility by leveraging advanced motion sensors, sophisticated control algorithms, on-board computers, real-time software, actuation motors and tailored rechargeable batteries.

**ReWalk** does it all for the user, while leaving the user in full control. Users walk with the assistance of crutches and control movement by creating subtle changes in center of gravity. Participation in mobility control comes naturally and intuitively, bringing tangible health and emotional benefits. **ReWalk** restores the element of control over mobility so lacking for wheelchair users.

## Health Benefits

As any sedentary wheelchair user can attest, life in a wheelchair carries a hefty healthcare price tag. Serious problems with the urinary, respiratory, cardiovascular and digestive systems are common, as well as osteoporosis, pressure sores and other afflictions.

Studies show that by maintaining users upright on a daily basis and exercising even paralyzed limbs in the course of movement, many of the health-related problems associated with long-term wheelchair use may be alleviated.

## About Argo Medical Technologies

Argo Medical Technologies develops and markets mobility restoration devices for people with lower limb disabilities. The company's flagship product - **ReWalk™** - offers an ambulation alternative to wheelchair users, enabling people with lower limb disabilities to stand, walk and ascend/descend stairs and more.

Argo Medical Technologies was founded in 2001 and is situated in northern Israel. The Company is operated by a team of experts in R&D, multidisciplinary systems manufacturing and marketing - bringing unique know-how in the field of locomotion impairment.

## Less Support and Training Equipment

The adoption of **ReWalk** by wheelchair users can result in cost saving for both institutions and private homes. **ReWalk** makes standing devices, stair lifts and other mobility assistive apparatus redundant.

In institutions, **ReWalk-I** can serve as a robotic therapeutic or physical training device used for intensive functional locomotion therapy and replace or supplement expensive mechanized gait trainers.

## Maturity and Safety

**ReWalk** has proven its safety and efficacy in successful clinical trials at the Sheba Medical Center, Israel and during a two-year clinical trial at the Moss-Rehab Medical Center, Philadelphia, USA. Additional clinical studies are being carried out in the USA and Europe.
